-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 23 November 2005.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-4,6-8 and 10-24 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-4,6-8 and 10-24 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Double Patenting

The terminal disclaimer has been received and approved.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-8, 10-13, 18-22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kelly et al. (4,055,669) in view of Froseth et al. (6,592,915) and Rombauer et al., p. 708.

The hedonic score as in claim 1 of at least 5.2 is shown because the composition of Kelly can be a bar and does provide energy and nothing is seen that the bar would not have the claimed hedonic value (abstract).

A confidence level of 60% is seen to have been shown as it would inherently have this value since the product is an energy bar (abstract) as in claim 2 and acceptability since it is an energy bar and would inherently have this consumer acceptability as in claim 3 absent a showing to the contrary.

Kelly et al. disclose making a binder composition of fat, sodium caseinate (protein) and milk solids, and sugar to make a homogenous mixture, to which sensitive

Art Unit: 1761

components such as vitamins and minerals, emulsifiers and colors are added at a temperature, and within a degree of mixing in a mixer that will not crush the particles as in claims 4, and 8 (col. 5, lines 54-66, col. 6, lines 29-60). The reference discloses that the blending is a critical operation that was done at temperatures from 100 to 140 F. and limited to the extent necessary to wet the added cereal particles.

The functional ingredients are seen to have been strategically positioned as they are positively mixed into the bar as in claims 5 and 9 (col. 6, lines 29-60).

The protein powder is sodium caseinate which has been rolled with other ingredients to the size of 50 microns as in claims 6 and 10. The protein powders would have had to have been about the claimed caseinate size of at least 35 microns since all the ingredients are 50 microns (col. 6, lines 38-60).

This composition would make a chewy energy bar with an acceptability of at least 4.9 due to the use of the claimed ingredients as in claim 7 (col. 6, lines 29-60).

Claims 1-13, 18-20 also require that the compositions contain particular amounts of proteins, fat, and carbohydrates in a bar containing particular amounts of calories, particular serving size and moisture content. However, particular amounts, moisture content, calories and serving sizes are seen to have been within the skill of the ordinary worker. Attention is invited to *In re Levin*, 84 USPQ 232 and the cases cited therein, which are considered in point in the fact situation of the instant case, and wherein the Court stated on page 234 as follows:

This court has taken the position that new recipes or formulas for cooking food which involve the addition or elimination of common ingredients, or for treating

Art Unit: 1761

them in ways which differ from the former practice, do not amount to invention, merely because it is not disclosed that, in the constantly developing art of preparing food, no one else ever did the particular thing upon which the applicant asserts his right to a patent. In all such cases, there is nothing patentable unless the applicant by a proper showing further establishes a coaction or cooperative relationship between the selected ingredients which produces a new, unexpected, and useful function. In re Benjamin D. White, 17 C.C.P.A (Patents) 956, 39 F.2d 974, 5 USPQ 267; In re Mason et al., 33 C.C.P.A. (Patents) 1144, 156 F.2d 189, 70 USPQ 221. Even if the claimed ingredients are not exactly as claimed, it would have been obvious to vary amounts and ingredients as in using various recipes as the function of each ingredient is known (Froseth et al. (col. 26, lines 49-56). Therefore, it would have been obvious to use particular amounts of ingredients, calories, serving sizes and moisture content in the claimed compositions.

The independent claims have also been amended to require the particular ingredients are selected from the corresponding Markush grouping. However, the ingredients in each of the group seem to include any and all relevant types of protein fats and proteins and as in In re Levin above, nothing new is seen in using known ingredients for their known functions.

Claims 1 and 2 and other independent claims and dependent claims also have been amended to require slightly different amounts of ingredients. However, it is seen that it would have been within the skill of the ordinary worker to use particular amounts of known ingredients, absent a showing of unexpected results using the claimed amounts.

Therefore, it would have been obvious to use known ingredients in various amounts to make an energy bar and to vary known ingredients as shown in the reference to make it acceptable in taste.

Further, Froseth et al. disclose as in claim 4 adding sensitive food ingredients to a binder (abstract and Fig. 5A and col. 4, lines 36-44, col. 14, lines 61-70). The reference discloses that flavors are added last to avoid adverse affects from too much heat (col. 13, lines 9-11). Nothing is seen that the degree of mixing affects the sensitive components. The reference is aware that various process parameters such as temperature affects the ingredients. The velocity of mixing is well known to affect ingredients, hence the settings on mixers of slow to fast. Therefore, it would have been obvious to make a composition in which the temperature and shear were controlled.

Claim 11 further requires that an energy bar matrix is made by mixing a solid component into a syrup to make a energy bar matrix, and then mixing the matrix with a fat-carbohydrate matrix. Rombauer et al. disclose, in the recipe Pfeffernusse, an energy matrix made of corn syrup which is combined with a solid component which is grated lemon rind, which is mixed into a fat-carbohydrate matrix, which is butter and sugar (page 708). The energy bar is seen to be lubricious since it contains fat. Also, as in In re Levin: This court has taken the position that new recipes or formulas for cooking food which involve the addition or elimination of common ingredients, or for treating them in ways which differ from the former practice, do not amount to invention, merely because it is not disclosed that, in the constantly developing art of preparing food, no one else ever did the particular thing upon which the applicant asserts his right to a

Art Unit: 1761

patent. In all such cases, there is nothing patentable unless the applicant by a proper showing further establishes a coaction or cooperative relationship between the selected ingredients which produces a new, unexpected, and useful function. In re Benjamin D. White, 17 C.C.P.A (Patents) 956, 39 F.2d 974, 5 USPQ 267; In re Mason et al., 33 C.C.P.A. (Patents) 1144, 156 F.2d 189, 70 USPQ 221. Therefore, it would have been obvious to make a composition with matrixes as shown by Rombauer as required in the composition of Kelly.

Claim 12 further requires adding well-known types of candies, which contain fat and carbohydrates into the energy bar. However, nothing new is seen in adding a fat-carbohydrate mixture as in chocolate chip cookies or bars, which contain chocolate chips or in cookies which contain the large chocolate kiss (Rombauer, page 705, chocolate-chip drop cookies). Therefore, it would have been obvious to add candy inclusions into an energy bar matrix for their known function of adding more fat and sugar in a tasteful formulation.

Claim 13 further requires the addition of fortification ingredients. Kelly et al. disclose the addition of vitamins and minerals to the binder of that composition (col. 5, lines 40-51). Therefore, it would have been obvious to fortify as shown by Kelly et al.

The limitations of claim 18 have been disclosed above by the above combination of references which would give the hedonic gains as in claims 19 and 20. Therefore, it would have been obvious to make the composition by processing sensitive ingredients as shown by Kelly et al., and strategically positioning functional ingredients as shown by Kelly and to use a fat carbohydrate matrix as disclosed by Rombauer et al. in the

Art Unit: 1761

process of Kelly et al. if one wanted to add more fat as shown by adding the candy inclusions of Rombauer (chocolate chips) or the fat carbohydrate matrix as shown on page 708 of Rombauer et al.

Claims 14-17 are rejected under 35 U.S.C. 102(b) as being anticipated by Rombauer et al. (Joy of Cooking, page 708).

Claims 14 further and 16 require that an energy bar matrix is made by mixing a solid component into a syrup to make a energy bar matrix, and then mixing the matrix with a fat-carbohydrate matrix. Rombauer et al. disclose, in the recipe Pfeffernusse, an energy matrix made of corn syrup which is combined with a solid component, grated lemon rind, which is mixed into a fat-carbohydrate matrix (butter and sugar)(page 708). The composition is considered to have a lubricious mouthfeel since the claimed ingredients are used.

. Claims 14-17 further require particular amounts of ingredients, calories and moisture content and serving size. However, In re Levin applies as above. Therefore, it would have been obvious to use particular amounts, calories and moisture contents and serving size to make an energy bar. The composition is considered to have the claimed hedonic score as in claims 15 and 17 as the composition has been shown

Claim 21 further requires a particular fat to carbohydrate ratio. However, this ratio is so large, that it is seen that it would have been within the skill of the ordinary worker to vary the ratio depending on whether a low-calorie or a less sweet bar is required. The further ingredients are well known food ingredients used in making food bars, and nothing unexpected as in In re Levin is seen in their use. Therefore, it would

Art Unit: 1761

have been obvious to vary the amount of fat to carbohydrate ratio, in order to make a good tasting bar, or a low fat or sugar bar.

Claim 22 further requires a particular moisture content. No moisture content is found for Kelly. However, as no water is added to the composition and the composition contains the claimed ingredients, it is seen that the moisture content would have been within the claimed amount in Kelly. Froseth et al. disclose a Aw of from 0.35 to 0.55 which is seen to have been within the claimed range (col. 2, lines 60-70). Therefore, it would have been obvious to make a bar with the claimed moisture content.

Claims 23 and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over the above combined references as applied to claims 1-22 above, and further in view of Avera (3,615,590).

Avera discloses a nut butter with a particle size of 96 % which would pass through a US sieve of 200 mesh size which is 75 microns, which leaves less than 10% having a particle size of less than 75 microns (col. 2, lines 65-70). No patentable distinction is seen at this time in the sizes of less than 10% as most of the particle sizes are within the claimed range. Therefore, it would have been obvious to use a nut butter which contains plant protein in near the claimed amounts in the process of the combined references because the reference discloses that protein is known in the claimed amounts.

ARGUMENTS

Applicant's arguments filed 11-23-05 have been fully considered but they are not persuasive. Applicants argue that the claimed ingredients have not been shown in particular amounts. However, the combined references disclose that the various ingredients are known. As in *In re Levin*, nothing new is seen in combining ingredients for their known function.

Applicants argue as to the caseinate that the particle size would have only been 30 microns. However, nothing new or unobvious has been shown in the use of sodium caseinate which is 35 microns instead of 30 microns.

It is not seen that the combined references do not show the method as to claim 18. The further limitations of the claims have been shown above or reasons given why they are obvious.

Applicants argue that the energy bars have a large following. However, the claims are so broad, except for claim 24 that nothing obvious is claimed and as in that claim peanut ingredients with the claimed particle size are known.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Helen F. Pratt whose telephone number is 571-272-1404. The examiner can normally be reached on Monday to Friday from 9:30 to 6:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Mr. Milton Cano, can be reached on 571-272-1398. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
